                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    099
modified enhancer region in a divergent orientation. The bi-directional promoter complex is useful for enhancing transcriptional activity of transgenes to improve agronomic performance used in genetic transformation with plants. Vectors that include the bi-directional promoter complex may be used to express foreign genes in mammalian cells and in plant cells including dicots and monocots. This sequence represents a bidirectional dual promoter complex useful for enhancing transcriptional activity of transgenes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      720

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  941
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention describes a bi-directional promoter complex comprising a modified enhancer region that includes at least 2 enhancer sequences, an at least 2 core promoters. The core promoters are on either side of the modified enhancer region in advergence or orientation. The bi-directional promoter complex is useful for enhancing transcriptional activity of transgenes to improve agronomic performance used in genetic transformation with plants. Vectors that include the bi-directional promoter complex may be used to express foreign genes in mammalian cells and in plant cells including dicots and monocots. This sequence represents a bidirectional dual promoter complex useful for enhancing
                                                                                                                                                                                                           complement of this sequence is also claimed as SEQ ID number 4"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                109 AGAAGCTTCTGCAGTGAGACTTTTCAACAAAGGGTAATATCGGGAAACCTCCTCGGATTC

pUC18. The upstream region of the 35S promoter was exiced from plasmid as a HindIII-ECORV fragment (-343 to -90) and inserted saame plasmid between the HindIII and PBII sites. The enhanced thus contains a duplication of sequences -343 to -90. See also

This was inserted into the HinCII site of pUC18. The upstream region of the 3SS promoter was excised as a HindIII-ECORV fragment (extending from -143 to -90) and inserted into the same plasmid between the HindIII and PstI sites. The enhanced promoter thus contains a duplication of sequences between -343 ans -90. The promoter is used in plasmid pMON893 to express Bacillus thuringiensis toxin with a potentiating amt. Of a trypsin inhibitor. This is useful as an insecticide. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              235
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        199

The patent discloses a method for selectively enhancing the phosphonate and rice plants, by transforming the plants with an expression cassette. It comprises of a structural DNA sequence, that encodes an aminomethyl phosphonic acid (AMPA) acyltransferase or transacylase (AAT), capable of Nacylation of AMPA. This sequence has an amino terminal chloroplast transit peptide (CTP), that targets AAT to the chloroplast Co-expression of glyphosate oxidase (GOX) gene, encoding glyphosate oxidase (GOX) gene, encoding glyphosate oxidoreductase, along with AAT provides the transformed plants with higher resistance to phosphonate herbicides. This method is useful for enhancing phosphonate herbicides such as glyphosate and AMPA tolerance, in recombinant plants and to prevent self-fettilisation and enhance hetero-fertilisation. The
                                                                                                                                                                                                                                                                                                                                  present DNA sequence is the expression cassette-4, comprising a plant operable promoter and 5' sequences like, 5' untranslated region (UTR) and intron, linked to modified E coli phnO coding region encoding P2A AMPA acyltransferase (AAT) enzyme and plant operable termination sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     116 TCTGCAGTGAGACTTTTCAACAAAGGGTAATATCGGGAAACCTCCTCGGATTCCATTGCC 175

The patent discloses a method for selectively enhancing the phosphonate herbicide tolerance in recombinant corn, tobacco, wheat, cotton, canola and rice plants, by transforming the plants with an expression cassette. It comprises of a structural DNA sequence, that encodes an aminomethyl phosphonic acid (AMPA) acyltransferase or transacylase (AAT), capable of N-acylation of AMPA. This sequence has an amino terminal chloroplast transit peptide (CTP), that targets AAT to the chloroplast. Co-expression of glyphosate oxidase (GCX) gene, encoding glyphosate oxidoreductase, along with AAT provides the transformed plants with higher resistance to phosphonate herbicides. This method is useful for enhancing phosphonate
                                                                                                                                                   acylransferase; transacylase; recombinant plant; expression cassette; corn; tobacco; wheat; cotton; canola; rice; chloroplast transit peptide; CTP; glyphosate oxidase; GOX; glyphosate oxidase; GOX; glyphosate oxidase; phnO gene; self-fertilisation; hetero-fertilisation; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /function= "Transfers acyl group from an acylcarrier
(CoA) to the free amino group of aminomethylphosphonate"

herbicides such as glyphosate and AMPA tolerance, in recombinant plants and to prevent self-fertilisation and enhance hetero-fertilisation. The present DNA sequence is the expression cassette-2, comprising a plant operable promoter and 5' sequences like, 5' untranslated region (UTR) and intron, linked to modified E. coli phno coding region encoding P2A AMPA acyltransferase (AAT) enzyme and plant operable termination sequences

The patent discloses a method for selectively enhancing the phosphonate herbicide tolerance in recombinant corn, tobacco, wheat, cotton, canola and rice plants, by transforming the plants with an expression cassette. It comprises of a structural DNA sequence, that encodes an aminomethyl phosphonic acid (AMPA) acyltransferase or transacylase (AAT), capable of Nacylation of AMPA. This sequence has an amino terminal chloroplast transit peptide (GTP), that targets AAT to the chloroplast. Co-expression of glyphosate oxidase (GOX) gene, encoding glyphosate oxidoreductase, along with AAT provides the transformed plants with higher resistance to phosphonate herbicides. This method is useful for enhancing phosphonate herbicides such as glyphosate and AMPA tolerance, in recombinant plants and to prevent self-fertilisation and enhance hetero-fertilisation. The operable promoter and 5' sequences like intron, linked to modified E. Coli photo coding region, encoding PPA AMPA acyltransferase (AAT) enzyme
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         TCTGCAGTGAGACTTTTCAACAAAGGGTAATATCGGGAAACCTCCTCGGATTCCATTGCC 175

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is an expression cassette from a Cry3Bb plant expression vector pMON3748. It comprises an enhanced Cauliflower mosaic virus (CaMV) 35S promoter sequence, a wheat chlorophyll A/B binding protein untranslated leader sequence, a rice actin intron sequence, a Bacillus thuringiensis delte-endotoxin Cry3Bb variant 11231mv2 coding sequence and a wheat heat shock Hsp17 transcription termination and polyademylation sequence. This expression cassette is used to improve expression of Cry3B variant protein in transgenic plants e.g. maize, to increase insecticidal activity against Coleopteran pests. (Updated on 15-SEP-2003 to standardise OS field)

B. thuringiensis delta endotoxin Cry3Bbl 11231mv2 expression cassette #2.
                                                                                                         The invention relates to novel transgenic plants comprising Bacillus thuringiensis Cry3-delta-endotoxin gene or its variants having coleopteran inhibitory activity. The invention is useful for controlling Coleopteran insect infestation in a field of crop plants. The present sequence is B. thuringiensis Cry3Bb-delta- endotoxin variant expression vector DNA
                 comprises Bacillus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              148 Arcarrecearaaaggaaageccarecregaagarecerereceacaeregereceaaag

The invention relates to a modified polynuclectide which encodes an insecticidal crystal 3 (Cry3) Bacillus thuringiensis delta-endotoxin such as CryBb. The modified polynuclectide is useful for producing a transformed cell, by introducing the modified polynuclectide into a cell such as a plant cell (preferably a maize cell) or a microbial cell. The modified polynuclectide is useful for producing a transformed maize plant cell and regenerating a maize plant cell. by introducing the modified polynuclectide into a maize plant cell. Crom the transformed maize plant cell. A transgenic plant expressing the modified polynuclectide is useful for controlling coleopteran insect infestation in a field of crop plants. The modified polynuclectide is useful for producing transgenic plants expressing higher levels of the insect controlling B. thuringiensis delta-endotoxin. The modified polynuclectide provides up to 10 fold higher levels of insect controlling compositions. In particular, transgenic maize expressing higher levels of the Cry3Bb protein designed to exhibit increased toxicity toward to compositions. In particular, transgenic maize expressing higher levels of the Cry3Bb protein designed to exhibit increased toxicity toward compositions are resistant to the insecticidally active protein. Improved control of

susceptible target insect pests and season long protection from insect pathogens is achieved using the modified polynucleotide. The modified polynucleotide reduces the number of transgenic events that have to be screened in order to identify one which contains beneficial levels of one or more insect controlling compositions. The present sequence represents Bacillus thuringiensis delta endotoxin Cry3Bbl 11231mv2 expression cassette #2 DNA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is an expression cassette from a Cry3Bb plant expression vector pMON33710. It comprises an enhanced Cauliflower mosaic virus (CaMV) 355 promoter sequence, a maize Hsp70 intron sequence, a Bacillus thuringiensis delta-endotoxin Cry3Bb variant AAV11231 coding sequence and a nopaline synthase transcription termination and polyadenylation sequence. This expression cassette is used to improve expression of Cry3B variant protein in transgenic plants e.g. maize, to increase insecticidal activity against Coleopteran pests. The invention relates to a modified polynucleotide which encodes an insecticidal crystal 3 (Cry3) Bacillus thuringlensis delta-endotoxin such as CryBb. The modified polynucleotide is useful for producing a transformed cell, by introducing the modified polynucleotide into a cell such as a plant cell (preferably a maize cell) or a microbial cell. The modified polynucleotide is useful for producing a transformed maize plant by introducing the modified polynucleotide into a maize plant cell. by introducing the modified polynucleotide into a maize plant cell, by introducing a transformed maize plant cell and regenerating a maize plant from the transformed maize plant cell. A transgenic plant expressing the modified polynucleotide is useful for controlling Coleopteran insect infestation in a field of crop plants expressing higher levels of the insect controlling B. thuringlensis delta-endotoxin. The modified polynucleotide provides up to 10 fold higher levels of insect controlling
                                                                                                                              Cry3Bbv11231, ds, gene, delta-endotoxin, plant, transgenic, insecticide, crystal 3, Cry3, Coleopteran insect infestation, increased toxicity, season long protection; beetle, maize, expression cassette.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /note= "Agrobacterium tumefaciens nopaline synthase transcription terminator and polyadenylation sequence"

thuringiensis crylBb-related

```
delta-endotoxin relative to the highest levels obtained using prior compositions. In particular, transgenic maize expressing higher levels of the CryBb protein designed to exhibit increased toxicity toward Coleopteran pests deliver superior levels of insect protection and are less likely to sponsor development of populations of target insects that are resistant to the insecticidally active protein. Improved control of susceptible target insect pests and season long protection from insect pathogens is achieved using the modified polynucleotide. The modified polynucleotide reduces the number of transgenic events that have to be screened in order to identify one which contains beneficial levels of one

This invention relates to a novel polynucleotide sequence optimised for expression of an insecticidal protein in a plant. The invention may be useful for the production of pesticides whilst the disclosed sequences may be used for gene therapy. The polynucleotide sequence and methods are useful in the control of lepidopteran insect pests, and for producing transgenic plants with the ability to resist insect infestations. The invention provides polynucleotide sequences with enhanced, improved and optimised expression in monocot and dicot plant species. The present sequence is that of a B thuringiensis crylBb expression cassette which is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           235
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        295

This invention relates to a novel polynucleotide sequence optimised for expression of an insecticidal protein in a plant. The invention may be useful for the production of pesticides whilst the disclosed sequences may be used for gene therapy. The polynucleotide sequence and methods are useful in the control of lepidopteran insect pests, and for producing transgenic plants with the ability to resist insect infestations. The invention provides polynucleotide sequences with enhanced, improved and optimised expression in monocot and dicot plant species. The present sequence is that of a B thuringiensis crylBb expression cassette which is

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
